DEAR CUSTOMER,

This report contains the 2009 test results on your drinking water. Hundreds of thousands of tests have confirmed that your water quality is excellent.

Over the last 25 years, MWRA has made major improvements to the water system that will ensure the delivery of great water to your tap for decades to come. The major water main break in May really emphasized the importance of this work and the work that is still left to do.

Fortunately, we were able to get the pipe fixed and the system back to normal within 60 hours. The precautionary boil water order was necessary to ensure your safety. I apologize for the inconvenience and would like to thank you all for your patience and cooperation.

For 2009, MWRA met every standard for 120 contaminants. System-wide, we have been below the Lead Action Level for 12 consecutive sampling rounds. Please see your community's letter for more information on your local water system.

Please take a moment to read this important information. We want you to share our confidence in your drinking water.

Sincerely,

Frederick A. Laskey
Executive Director

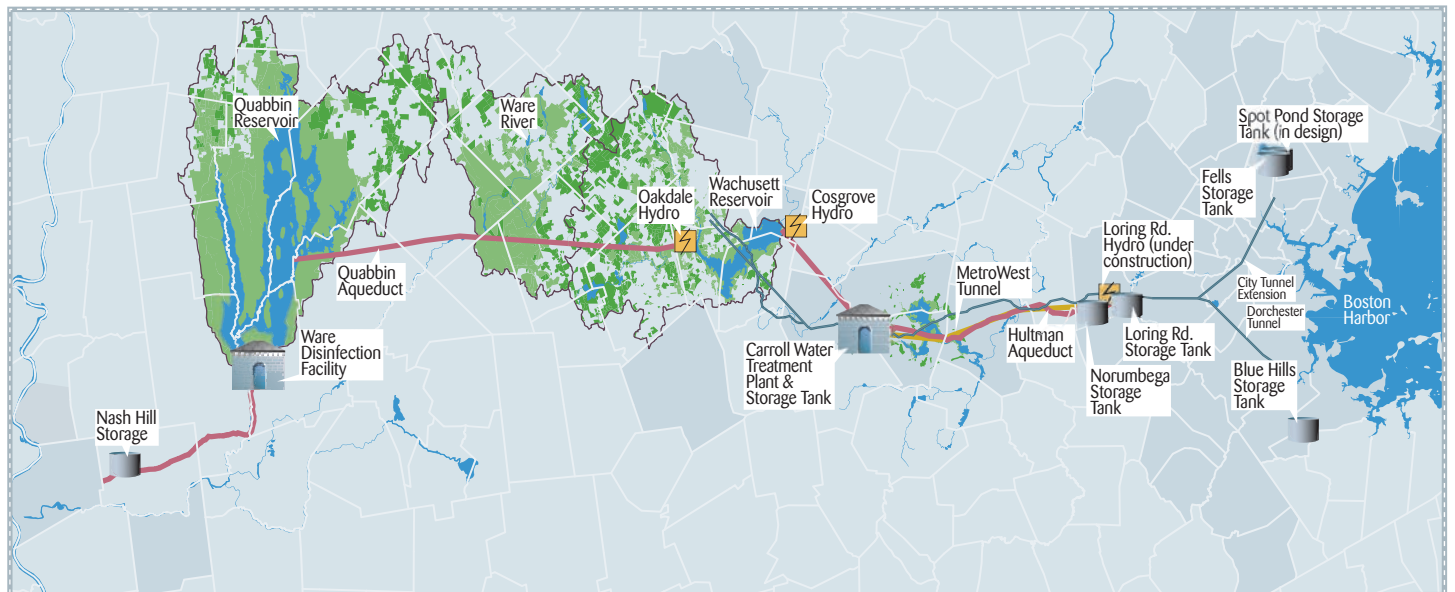

Where does your water come from?

Your water comes from the Quabbin Reservoir, about 65 miles west of Boston, and the Wachusett Reservoir, about 35 miles west of Boston. These reservoirs supply wholesale water to local water departments in 51 communities. The two reservoirs combined supplied about 194 million gallons a day of high quality water to consumers in 2009. Your water also comes from local water supplies. Please see page 4 for more information.

Quabbin and Wachusett watersheds are protected naturally with over 85% of the watersheds covered in forest and wetlands. To ensure safety, the streams and the reservoirs are tested often and patrolled daily by the Department of Conservation and Recreation (DCR). Rain and snow falling on the watersheds - protected land around the reservoirs - turn into streams that flow to the reservoirs. This water comes in contact with soil, rock, plants, and other material as it follows its natural path to the reservoirs. While this process helps to clean the water, it can also dissolve and carry very small amounts of material into the reservoir. Minerals from soil and rock do not typically cause problems in the water. But, water can also transport contaminants from human and animal activity. These can include bacteria, viruses, and fertilizers - some of which can cause illness. The test data in this report show that these contaminants are not a problem in your reservoir's watersheds.

The Department of Environmental Protection (DEP) has prepared a Source Water Assessment Program report for the Quabbin and Wachusett Reservoirs. The DEP report commends DCR and MWRA on the existing source protection plans, and states that our watershed protection programs are very successful and greatly reduce the actual risk of contamination. The report recommends that we maintain present watershed plans and continue to work with the residents, farmers, and other interested parties to maintain the pristine watershed areas. Your water also comes from local supplies that have a separate report.

As water travels eastward through tunnels from the Quabbin and Wachusett Reservoirs, clean hydroelectric energy is produced. The electricity generated is used to reduce MWRA's energy demands.

From the Reservoir to Your Home

WATER TREATMENT

Your water is treated at the John J. Carroll Water Treatment Plant in Marlborough. The first treatment step is disinfection of reservoir water with ozone to kill any pathogens (germs) that may be present in the water. Fluoride is then added to reduce cavities. Next, the water chemistry is adjusted to reduce corrosion of lead and copper from home plumbing. Last, we add mono-chloramine, a mild and long-lasting disinfectant which protects the water while it is in the local pipelines. Your local water supply may have different treatment. Please see page 4 for more information.

MWRA'S IMPROVEMENTS TO WATER SUPPLY

2010 marks the 25th anniversary of the MWRA. In that time, MWRA and our community partners have made improvements to the entire water system: from the the watersheds, to the aqueducts and tunnels, to treatment plants and MWRA and local pipelines. These are the largest investments in the water system since the 1930s. MWRA and our community partners continue to make the necessary investments to maintain and upgrade our facilities. For instance in 2009, MWRA completed the Blue Hills covered storage tank in Quincy.

TESTING YOUR WATER —EVERY STEP OF THE WAY

Test results show few contaminants are found in the reservoir water. The few that are found are in very small amounts, well below EPA's standards. Turbidity (or cloudiness of water) is one measure of overall water quality. It should never be over 5 NTU (Nephelometric Turbidity Units) and can be over 1 NTU only if we can demonstrate that disinfection is not affected. Typical levels at Wachusett Reservoir are 0.35 NTU. In 2009, turbidity was always below both the 5.0 and 1.0 NTU standards, with the highest level at 0.66.

MWRA also tests reservoir water for pathogens - such as fecal coliform, bacteria, viruses, and the parasites *Cryptosporidium* and *Giardia*. They can enter the water from animal or human waste. All test results were well within state and federal testing and treatment standards.

What is Ozone?

Ozone consists of three atoms of oxygen. It is created by applying an electrical current to pure oxygen in a specially designed chamber. Ozone provides better disinfection than chlorine alone, especially against *Cryptosporidium* and other hard to kill germs. It also reduces the amount of potentially harmful chlorine byproducts.

Information About Cross Connections

Massachusetts DEP recommends the installation of backflow prevention devices for inside and outside hose connections. For

more information on cross connections and how to help protect the water in your home as well as the drinking water system in your town, please call 617-242-5323 or visit www.mwra.com/crosscon.html.

FACTS ABOUT SODIUM

Sodium in water contributes only a small fraction of a person's overall sodium intake (less than 10%). MWRA tests for sodium monthly and the highest level found was 37.4 mg/L (about 9 mg per 8 oz. glass). This would be considered VERY LOW SODIUM by the Food and Drug Administration (FDA).

Test Results - After Treatment

EPA and State regulations require many water quality tests after treatment to check the water you are drinking. MWRA conducts tens of thousands of tests per year on over 120 contaminants (a complete list is at www.mwra.com). For results on your local water supply, please see page 4.

The only contaminants found are listed below, and all levels met EPA's standards. The bottom line is that the water quality is excellent.

Compound	Units	(MCL) Highest Level Allowed	(We found) Detected Level-Average	Range of Detections	(MCLG) Ideal Goal	Violation	How it gets in the water
BARIUM	ppm	2	0.01	0.009-0.011	2	No	Common mineral in nature
MONO-CHLORAMINE	ppm	4-MRDL	1.9	0-3.6	4-MRDLG	No	Water disinfectant
FLUORIDE	ppm	4	1.02	0.36-1.2	4	No	Additive for dental health
NITRATE [^]	ppm	10	0.14	0.06-0.14	10	No	Atmospheric deposition
TOTAL TRIHALOMETHANES	ppb	80	12.2	1.0-35.4	ns	No	Byproducts of water disinfection
HALOACETIC ACIDS-5	ppb	60	12.4	0-35.4	ns	No	Byproducts of water disinfection

KEY: **MCL**=Maximum Contaminant Level. The highest level of a contaminant allowed in water. MCLs are set as close to the MCLGs as feasible using the best available technology. **MCLG**=Maximum Contaminant Level Goal. The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. **MRDL**=Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. **MRDLG**=Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected health risk. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination. **ppm**=parts per million **ppb**=parts per billion **ns**=no standard [^]As required by DEP, the maximum result is reported for nitrate, not the average.

Town of Bedford
DEPARTMENT OF PUBLIC WORKS

Dear Bedford Resident,

The Department of Public Works thanks you for taking the time to review the annual drinking water quality report provided in partnership with the Massachusetts Water Resources Authority (MWRA). Our Town supplies water to 13,315 residents. The water is supplied from groundwater originating at the Shawsheen well field (14% of the total) and the remaining volume (86%) is a surface water source from MWRA. The water quality from the Shawsheen well field is summarized as follows:

HALOACETIC ACIDS: (Taken quarterly.) The annual average was 2.43 parts per billion. The state maximum is 60 parts per billion.

INORGANICS: (Taken in the 3rd quarter only.) A value of 0.019 milligrams/liter was found for Barium and the state limit is 2.0 milligrams per liter. Since we also fluoridate for dental hygiene, the fluoride level was 1.2 milligrams/liter and the maximum allowed is 4.0 milligrams/liter. The sodium level was 38.9 milligrams/liter. Currently there is no Maximum Contaminant Level set by the State of Massachusetts for this constituent.

NITRATE: (Taken in the 3rd quarter only.) A value of 0.02 milligrams/liter was found and the State maximum level is 10.0 milligrams/liter.

PERCHLORATE: (Taken in the 3rd quarter only.) No perchlorate was found (<0.2 parts per billion) and the State limit is 2.0 parts per billion.

SYNTHETIC ORGANIC COMPOUNDS: 45 parameters are monitored in this test and the test was conducted in the 1st and 3rd quarters. All 90 tests came well under any level set by DEP or EPA.

TRIHALOMETHANES: (Taken quarterly.) The annual average was 6.23 parts per billion. The state maximum is 80 parts per billion.

VOLATILE ORGANIC COMPOUNDS: This test is required every quarter. In one year, there were 84 tests done on regulated compounds, meaning there were numerical limits placed on the compounds. In 2009, all tests came back "ND", none detected. We also tested for volatile organic compounds that were unregulated compounds, meaning no limits had been assigned by EPA or the State. Of 156 tests of such unregulated compounds conducted in 2009, 155 came back "ND", none detected, while one compound (Bromoform) was detected at 0.86 parts per billion in the 3rd quarter exclusively and then was never detected again.

In summary, all the testing conducted in 2009 at the Shawsheen well field showed that the water quality was exceptionally good, meeting all State and Federal quality control guidelines. Should you have any questions concerning water quality in the Town of Bedford, please feel free to contact me at 1-781-275-7605, x105. We welcome your questions and comments.

Respectfully submitted,

Peter W. Churchill
Operations Manager
Bedford Water & Sewer Division

HOW WOULD I KNOW ABOUT A PROBLEM WITH MY WATER SUPPLY?

MWRA and your local water department keep a close watch on the water supply. If there is a problem with your water, you would get the news by radio, television, newspapers, state and local government, health officials, and from MWRA.

Important Information from EPA and DEP

➔ **Drinking Water and People with Weakened Immune Systems**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections.

These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

➔ **Contaminants In Bottled Water And Tap Water**

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791) or MWRA. In order to ensure that tap water is safe to drink, the Massachusetts DEP and EPA prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) and the Massachusetts Department of Public Health regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Tests in Community Pipes

MWRA and local water departments test 300 to 500 water samples each week for total coliform bacteria. These bacteria can come from the intestines of warm-blooded animals, or can be found in soil, plants, or other places. Most of the time, they are not harmful. However, their presence could signal that harmful bacteria from fecal waste may be there as well. The EPA requires that no more than 5% of the total coliform samples in a month can be positive. If a water sample does test positive, we run more specific tests for *E. coli*, which is a bacteria found in human and animal waste and can cause illness.

RESEARCH FOR NEW REGULATIONS

MWRA has been working with EPA and other researchers to define new national drinking water standards by testing for unregulated contaminants. In order to better understand the water supply and treated water, MWRA has voluntarily been testing for *Cryptosporidium* and *Giardia*.

Total Coliform Results		
Community	Highest % of positive samples and month	Violation of EPA's 5% limit
Needham	2.3% (June)	No
MWRA	0.7% (Sept.)	No

How Did We Do In 2009?
The table reports test results from 10 communities that receive some, but not all, of their water from MWRA. Total coliform was found in one community. No *E. coli* was found in any of these MWRA communities in 2009. No communities exceeded the EPA standard.

Ongoing Research For New Regulations

Test	Measurement Units	2009 Average
<i>Cryptosporidium</i>	oocysts per 100L	0.01^
<i>Giardia</i>	cysts per 100L	0.17
NDMA	ng/L	0.54*

KEY: ng/L=nanograms per liter (parts per trillion) ^Proposed treatment threshold is 1 oocyst per 100 liters. *The DEP "guidance value" is 10 ng/L

What You Need to Know About Lead in Tap Water

MWRA water is lead-free when it leaves the reservoirs. MWRA and local pipes that carry the water to your community are made mostly of iron and steel, and do not add lead to water. However, lead can get into tap water through pipes in your home, your lead service line, lead solder used in plumbing and some brass fixtures. Corrosion or wearing away of lead-based materials can add lead to tap water, especially if water sits for a long time in the pipes before it is used.

In 1996, MWRA began adding sodium carbonate and carbon dioxide to adjust the water's pH and buffering capacity. This change has made the water less corrosive, thereby reducing the leaching of lead into drinking water. Lead levels found in sample tests of tap water have dropped by over 80 percent since this treatment change.

MWRA MEETS LEAD STANDARD IN 2009

Under EPA rules, each year MWRA and your local water department must test tap water in a sample of homes that are likely to have high lead

levels. These are usually homes with lead service lines or lead solder. The EPA rule requires that 9 out of 10, or 90%, of the sampled homes must have lead levels below the Action Level of 15 parts per billion (ppb).

The following results are for the MWRA system. For lead and copper results for your local water supply, please see page 4. All 12 sampling rounds over the past six years have been below the EPA standard. Results for 453 samples taken in September 2009 are shown in the table. 9 of 10 houses were below 10.6 ppb, which is below the Action Level of 15 ppb. Some individual communities had more than one home test above the Action Level for lead. If you live in one of these communities, your town letter will provide you with more information.

What Can I Do To Reduce Exposure To Lead In Drinking Water?

Run the tap until after the water feels cold. To save water, fill a pitcher with fresh water and place in refrigerator for future use.

Never use hot water from the faucet for drinking or cooking - especially when making baby formula or other food for infants.

Ask your local water department if there are lead service pipes leading to your home.

Check your plumbing fixtures to see if they are lead-free. Read the labels closely.

Test your tap water. Contact MWRA at 617-242-5323 or www.mwra.com for more tips and a list of certified labs.

Be careful of places you may find lead in or near your home. Paint, soil, dust, and some pottery may contain lead.

Call the Department of Public Health at 1-800-532-9571 or EPA at 1-800-424-LEAD for health information.

Important Information from EPA About Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. MWRA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or at www.epa.gov/safewater/lead.

Water Conservation

Wasting water can add up quickly. On average, each person uses about 65 gallons of water each day. More efficient water use can reduce the impact on the water supply and on your wallet. Here are some ways to make your home and your habits more water efficient

The Inch Rule for Saving Water Outdoors

Most lawn, shrubs, vegetables, and flowers need just one inch of water per week. If there has been an inch of rainfall during the week, you don't have to water at all. Overwatering can actually weaken your lawn by encouraging shallow roots that are less tolerant of dry periods and more likely to be damaged by insects.

Follow Outdoor Water Saving Ground Rules

- Water your lawn (and other landscaping) in early morning or evening to avoid evaporation.
- Be sure sprinklers water only your lawn, not pavement.
- Never water on a windy, rainy, or hot day.
- Never use the hose to clean debris from your driveway or sidewalk. Use a broom.
- Apply mulch around flowers to reduce evaporation, promote plant growth, and control weeds.

How to Find and Fix Leaks

Dripping, trickling, or leaking faucets, showerheads and toilets can waste up to several hundred gallons of water a week, depending on the size of the leaks.

Worn-out washers are the main cause of leaks in faucets and showerheads. A new washer generally costs about 25 cents.

That trickling sound you hear in the bathroom could be a leaky toilet, but sometimes toilets leak silently. TRY THIS: Crush a dye tablet and carefully empty the contents into the center of the toilet tank and allow it to dissolve. Wait about 8 to 9 minutes. Inspect the toilet bowl for signs of dye indicating a leak.

If the dye has appeared in the bowl, your flapper or flush valve may need to be replaced. Parts are inexpensive and fairly easy to replace. If no dye has appeared in the 8 to 9 minutes, you probably don't have a leak.

Install a Low-Flow Showerhead and Faucet Aerator

Some showerheads may still use over 5 gallons per minute. A low-flow showerhead uses 2.5 gallons less and can save you over 20 gallons per 10-minute shower. In one year, that's over 7,000 gallons. Faucets can use 2 to 7 gallons of water per minute – a low-flow aerator can reduce the flow by about 25%.

For more water saving ideas or devices, call 617-242-SAVE or go to www.mwra.com.
