This report is required under the Federal Safe Drinking Water Act. MWRA PWS ID# 6000000

Dear Customer,

The Massachusetts Water Resources Authority is pleased to share with you the results of our annual water quality testing. MWRA and your local water department take hundreds of thousands of water quality tests to ensure your water is safe. The results for 2017 are excellent and MWRA again met every federal and state drinking water standard.

Since the MWRA was created in 1984, we have invested over $2 billion to rehabilitate and modernize the entire drinking water system. From state-of-the-art treatment, to covered storage tanks, to installing new redundant pipelines and replacing older pipes in the communities, we want to make sure the water that flows to your tap is of the highest quality. Investing in infrastructure improvements also plays a large part in the economic health of our region.

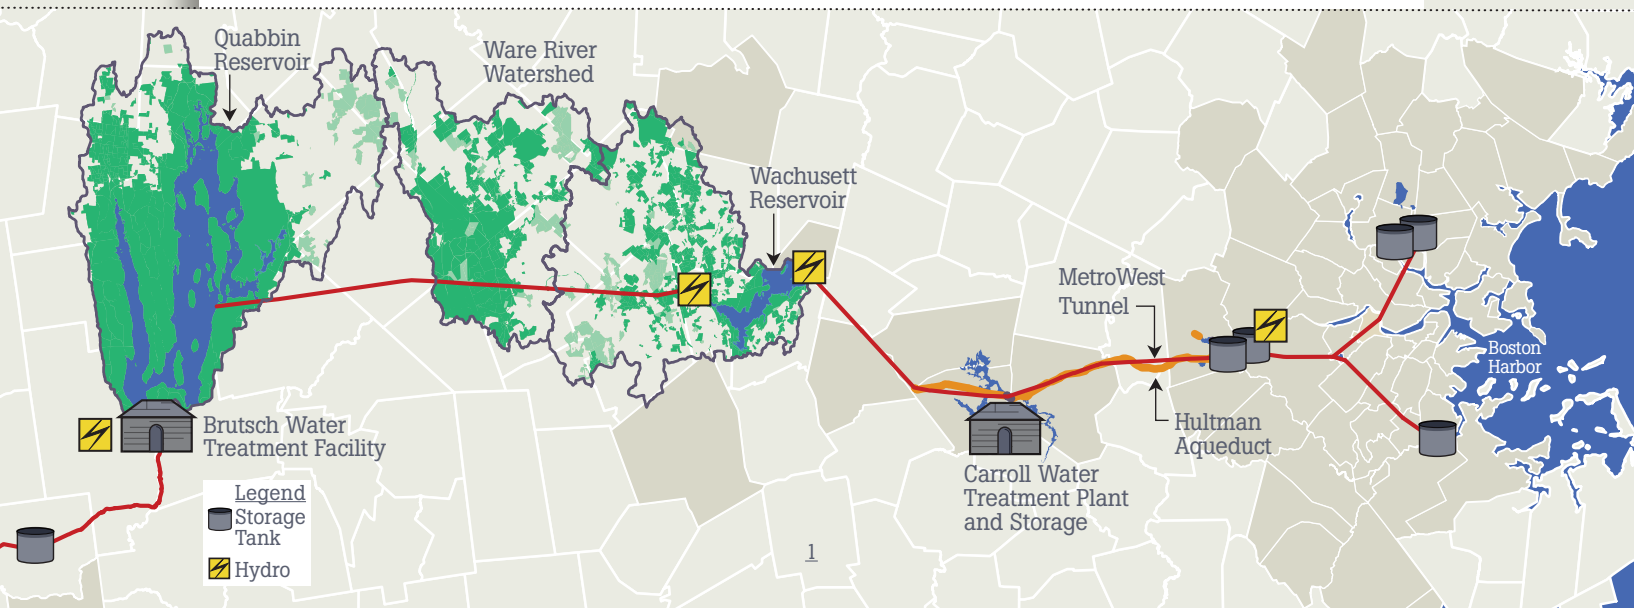
System-wide, MWRA has been below the lead action level for many years now, but there are still a number of lead service lines in our service area. Several of our member communities are taking advantage of our $100 million zero interest loan program and others are getting ready to do so. Our laboratory staff processes samples from homes and school across the service area. We continue to partner with the Massachusetts Departments of Environmental Protection and Public Health to make every effort to reduce the risk of lead at the tap to protect the health of the children in our member communities. More information on lead can be found on pages 4 and 5 of this report.

This report contains important information about your water system and we hope you take a few moments to read through it. MWRA has great confidence in the water we deliver to your home and we want you to share that confidence. Please contact us if you have any questions or comments about your water quality or any of MWRA's programs.

Sincerely,

Frederick A. Laskey
Executive Director

For more information on MWRA and its Board of Directors, visit www.mwra.com.



Drink Local And Be Green! Tap water is delivered straight to your home without trucking or plastic waste. Bottled water produces over 10,000 times the amount of greenhouse gases as tap water. More than half of our energy needs for water treatment and delivery are met with green power including hydroelectric generators and solar panels.

New Emergency Pump Station

Why Your Water Tastes Great – High Quality Source Water

Your water comes from the Quabbin Reservoir, about 65 miles west of Boston, and the Wachusett Reservoir, about 35 miles west of Boston. Water from the Ware River can also add to the supply at times. These pristine reservoirs supply wholesale water to local water departments in 51 communities. The two reservoirs combined supplied about 200 million gallons a day of high quality water to consumers in 2017.

The Quabbin and Wachusett watersheds are naturally protected with over 85% of the watersheds covered in forest and wetlands. To ensure safety, the streams and reservoirs are tested often and patrolled daily by the Department of Conservation and Recreation (DCR).

Rain and snow falling on the watersheds - protected land around the reservoirs - turn into streams that flow to the reservoirs. This water comes in contact with soil, rock, plants, and other material as it follows its natural path to the reservoirs. While this process helps to clean the water, it can also dissolve and carry very small amounts of material into the reservoir. Minerals from soil and rock do not typically cause problems in the water. But, water can also transport contaminants from human and animal activity. These can include bacteria and pathogens - some of which can cause illness. The test data in this report show that these contaminants are not a problem in your reservoirs' watersheds.

The Department of Environmental Protection (DEP) has prepared a Source Water Assessment Program report for the Quabbin and Wachusett Reservoirs.

The DEP report commends DCR and MWRA on the existing source water protection plans, and states that our "watershed protection programs are very successful and greatly reduce the actual risk of contamination." MWRA follows the report recommendations to maintain the pristine watershed areas.

Investing In Your Water System

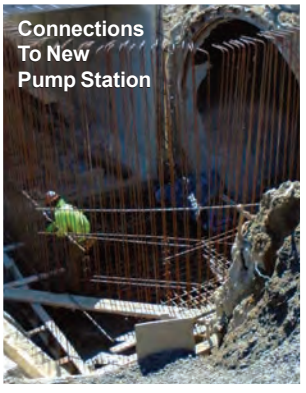
Now and for the foreseeable future, MWRA will continue to focus on ensuring redundancy for each water service area. That means providing a second means of getting water to an area if something happens to the primary pipeline – like a major water main break.

Progress has been steady and work is underway to the north in Stoneham, Reading and Woburn, and to the south in Boston and Dedham to provide redundancy for those areas. A new, emergency pump station in Marlborough will ensure we can get adequate water to the treatment plant in the event of a problem with the existing system.

MWRA is also beginning work to strengthen the major pipelines and tunnels serving large parts of the system. A project to repair and improve the 11-mile-long Weston Aqueduct Supply Main No. 3 is currently in design. This work will take place in in Weston, Waltham, Belmont, Arlington and Medford, and must be completed before a new, major tunnel project to the north and south can begin.

On Going Pipeline Rehabilitation

MWRA continues to rehabilitate and replace older pipelines throughout the distribution system to improve both reliability and water quality. MWRA has also provided zero-interest loans to communities for local pipeline projects since 1998. In 2017, $25.8 million was loaned to communities for 18 projects including the replacement of over 15.4 miles of older, unlined pipes with new cement-lined ductile iron water pipes or rehabilitation with cleaning and new cement lining.



Connections To New Pump Station

Always Use Water Wisely

We know that conservation works. Customers in the MWRA service area have reduced their average daily demand from 340 million gallons per day in 1980 to less than 200 million gallons today. It is important that these conservation efforts continue – especially during dry periods.

WATER SAVING TIPS FOR YOUR HOME

Indoors

- Install low-flow aerators on your faucets. You'll save 1 to 5 gallons per minute.
- Fix that leaky faucet. Worn-out washers can waste hundreds of gallons per week.
- Replace your washing machine with a high-efficiency model. You'll use 30 to 50% less water.
- Fix that leaky toilet. You'll save 50 gallons a day or more.

Outdoors

- Water your lawn overnight or before 5:00 a.m. If you water at mid-day, it will evaporate.
- One inch of water a week is plenty. After heavy rains, you may not need to water for 10 to 14 days.
- Use mulch in your flower beds. Mulch will keep roots cool and moist, and reduce weeds.

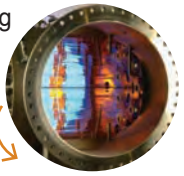
More tips are available at MWRA.com.

Monitoring Water Quality In Real Time. Your water is monitored by a state-of-the-art system in real time – 24 hours a day, seven days a week – to make sure it is free of contaminants. This allows MWRA to respond to changes in water quality almost immediately.

Quabbin Reservoir Overlook

Why Your Water Tastes Great – Water Treatment

Massachusetts Water Resources Authority has invested in state-of-the art treatment to make sure you water is clean, fresh, and tastes great. Part of the reason that the water tastes so good is MWRA's advanced treatment at the John J. Carroll Water Treatment Plant in Marlborough. Since 2005, your water has been treated with ozone - produced by pure oxygen. Ozone has ensured strong protection against microbes and viruses, improved water clarity, and makes the water taste better. In 2014, we also started adding ultraviolet (UV) disinfection, further improving the quality of water.



Ultraviolet (UV) Lamp

UV light is essentially a more potent form of the natural disinfection from sunlight, and ensures that any pathogens potentially in our reservoirs are rendered harmless.

In addition, fluoride is added to promote dental health, and the water chemistry is adjusted to reduce corrosion of home plumbing. Last, we add mono-chloramine, a mild and long-lasting disinfectant combining chlorine and ammonia to protect the water as it travels through miles of pipelines to your home.

Testing Your Water – Every Step of the Way

Test results show few contaminants are found in the reservoir water. The few that are found are in very small amounts, well below EPA's standards.

Turbidity (or cloudiness of the water) is one measure of overall water quality. All water must be below 5 NTU (Nephelometric Turbidity Units), and water can only be above 1 NTU if it does not interfere with effective disinfection. In 2017, turbidity was always below both the 5 and 1 NTU standards, with the highest level at 0.92 NTU. Typical levels at the Wachusett Reservoir are 0.35 NTU.

MWRA also tests reservoir water for pathogens such as fecal coliform, bacteria, and the parasites *Cryptosporidium* and *Giardia*. They can enter the water from animal or human waste. All test results were well within state and federal testing and treatment standards. For more information, please visit www.mwra.com/ucmr/2017.html.

Test Results – After Treatment

EPA and state regulations require many water quality tests after treatment to check the water you are drinking. MWRA conducts hundreds of thousands of tests per year on over 120 contaminants (a complete list is available on www.mwra.com). Details about 2017 test results are in the table below. The bottom line is the water quality is excellent.

Facts About Sodium

Sodium in water contributes only a small fraction of a person's overall sodium intake (less than 5%). MWRA tests for sodium monthly and the highest level found was 38.8 mg/L (about 8 mg per 8 oz. glass). This would be considered **VERY LOW SODIUM** by the Food and Drug Administration.

TEST RESULTS AFTER TREATMENT

COMPOUND	UNITS	(MCL) HIGHEST LEVEL ALLOWED	(WE FOUND) DETECTED LEVEL-AVERAGE	RANGE OF DETECTIONS	(MCLG) IDEAL GOAL	VIOLATION	HOW IT GETS IN THE WATER
Barium	ppm	2	0.009	0.007-0.01	2	No	Common mineral in nature
Mono-Chloramine	ppm	4-MRDL	2.14	0-3.85	4-MRDLG	No	Water disinfectant
Fluoride	ppm	4	0.70	0.31-0.78	4	No	Additive for dental health
Nitrate^	ppm	10	0.05	0.04-0.05	10	No	Atmospheric deposition
Nitrite^	ppm	1	0.006	ND-0.006	1	No	Byproduct of water disinfection
Total Trihalomethanes	ppb	80	15	4.2-25.2	ns	No	Byproduct of water disinfection
Haloacetic Acids-5	ppb	60	12.8	1.5-24	ns	No	Byproduct of water disinfection
Total Coliform	%	5%	0.8% (Aug)	ND-0.8%	0	No	Naturally present in environment
Combined Radium*	pCi/L	5	1.76	ND-1.76	0	No	Erosion of natural mineral deposits

KEY: MCL=Maximum Contaminant Level. The highest level of a contaminant allowed in water. MCLs are set as close to the MCLGs as feasible using the best available technology. **MCLG**=Maximum Contaminant Level Goal. The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. **MRDL**=Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. **MRDLG**=Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected health risk. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination. **ppm**=parts per million **ppb**=parts per billion **ns**=no standard **ND**=non detect **^**=As required by DEP, the maximum result is reported for nitrate and nitrite, not the average. *Result from 2014

What You Need To Know About Lead In Tap Water. MWRA water is lead-free when it leaves the reservoirs. MWRA and local pipes that carry the water to your community are made mostly of iron and steel and do not add lead to the water.

Did You Know?

Most cases of lead poisoning are from contact with peeling lead paint and paint dust. But drinking water exposed to lead can increase a person's total lead exposure. This is particularly a concern for small children and pregnant women. However, lead can get into tap water through pipes in your home, your service line if it is made of lead, lead solder used in plumbing, and some brass fixtures. Corrosion or wearing away of lead-based materials can add lead to tap water, especially if water sits for a long time in the pipes before it is used.

In 1996, MWRA began adding sodium carbonate and carbon dioxide to adjust the water's pH and buffering capacity. This change has made the water less corrosive, thereby reducing the leaching of lead into drinking water. Lead levels found in sample tests of tap water have dropped by about 90 percent since this treatment change.

SEPTEMBER 2017 LEAD & COPPER RESULTS

	Range	90% Value	(Target) Action Level	(Ideal Goal) MCLG	#Homes Above AL/ #Homes Tested
Lead (ppb)	0-102	8.6	15	0	18/456
Copper (ppm)	0-0.375	0.103	1.3	1.3	0/456

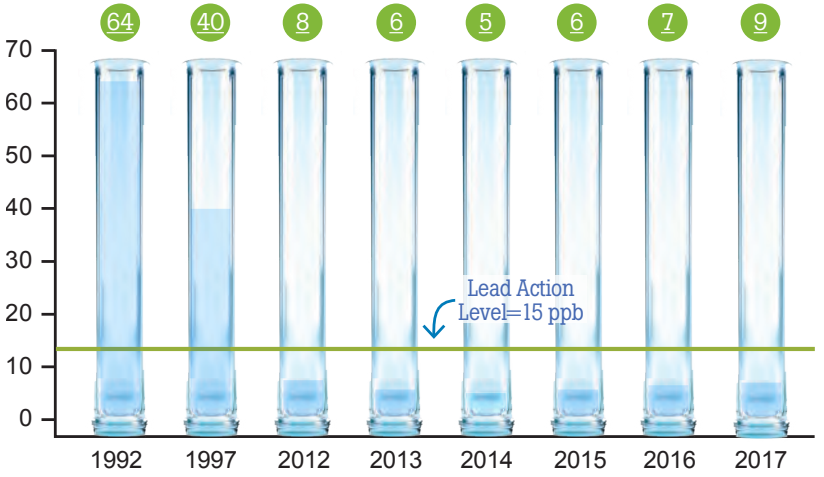
KEY: AL=Action Level-The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. Definition of **MCLG** available on page 3.

MWRA Meets Lead Standards In 2017

Under EPA rules, each year MWRA and your local water department must test tap water in a sample of homes that are likely to have high lead levels. These are usually homes with lead service lines or lead solder. The EPA rule requires that 9 out of 10, or 90%, of the sampled homes must have lead levels below the Action Level of 15 parts per billion (ppb).

All 22 sampling rounds over the past thirteen years have been below the EPA standard. Of the 2,300 samples taken in the last 5 years, 98% were below the 15 ppb level. Results for the 456 samples taken in September 2017 are shown in the table. 9 out of 10 houses were below 8.6 ppb, which is below the Action Level of 15 ppb. Four communities: Medford, Melrose, Quincy and Winthrop were individually above the Action Level for lead. Your community letter on page 7 will provide you with local results and more information.

90% LEAD LEVELS IN MWRA SYSTEM OF FULLY SERVED COMMUNITIES



WHAT CAN I DO TO REDUCE MY EXPOSURE TO LEAD IN DRINKING WATER?

1. Let the water run before using: fresh water is better than stale! To save water, fill a pitcher with fresh water and place in the refrigerator for future use.
2. Any time water has gone unused for more than 6 hours, run each faucet used for drinking or cooking until after the water becomes cold.
3. Never use hot water from the faucet for drinking or cooking, especially when making baby formula or other food for infants.
4. Check your plumbing fixtures to see if they are lead-free. Read the labels closely.
5. Remove loose lead solder and debris. Every few months remove the aerator from each faucet in your home and flush the pipes for 3-5 minutes.
6. Be careful of places you may find lead in or near your home. Paint, soil, dust and some pottery may contain lead.
7. Call the Department of Public Health at 800-532-9571 or EPA at 800-424-LEAD for health information.

MWRA Wins "Systems Taking Action to Reduce Lead" Award. MA DEP has recognized the effort that the MWRA has demonstrated to educate and work with the schools in all MWRA communities. By providing free testing of schools, MWRA is helping to ensure that children are not exposed to the dangers of lead.

Lead Service Line Being Replaced

What Is A Lead Service Line? What Is The Concern?

A service line is the pipe that connects your house to the water main in the street. Some service lines that run from older homes (constructed before 1940) are made from lead. Many of these older service lines have been replaced, but some remain. These service lines are the main source of lead to tap water in homes that have them. Therefore, removing lead service lines is a priority to reduce the potential for lead exposure, particularly if a pregnant woman or child lives at your home.

How Do I Replace My Lead Service Line?

If you have a lead service line, you should consider replacing it. Many communities have programs to help with the replacement cost. Removing the whole lead service line is important. It is the only way to ensure that your service line will not be adding lead to your water. Partial replacements - which leave some lead behind - do not lower lead levels, and in many cases, can actually increase lead levels.

MWRA Program To Replace Lead Service Lines

To help communities in removing lead service lines, MWRA and its Advisory Board approved a program to make available $100 million in zero-interest loans to its member communities to fully replace lead service lines. Each community can develop its own program, tailored to their local circumstances. Several communities have already moved forward with programs. To find out more, please read your community letter or contact your local water department.

How Do I Get My Homes's Tap Water Tested For Lead?

There is a list of labs and sampling instructions available on the lead testing page at www.mwra.com or you can call MWRA at 617-242-5323. Also, some communities have testing available for residents. Please contact your local water department for more information.

What's My Service Line?

You can identify a lead service line by carefully scratching it with a key. →

← Have it replaced with a new copper service line.

For more information on lead service lines go to mwra.com.

Important Information From EPA About Lead

If present, elevated levels of lead can cause serious health problems, especially for unborn babies and young children.

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. MWRA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components.

If your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap water for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or www.epa.gov/safewater/lead.

LEAD TESTING IN SCHOOLS

Starting in 2016, MWRA in coordination with DEP, provided no-cost lab analysis and technical assistance for schools and day care centers across all of MWRA's water communities. Almost all MWRA communities have already participated in the program, and sampling is still ongoing. Nearly 17,000 samples from 313 schools across 35 communities were received, and over 29,000 tests were completed. Results are available on the DEP website – www.mass.gov/dep (search for lead in schools). Some results also may be available through your local community website, DPW, or school department.

MWRA Takes Customer Concerns Seriously. Every call is investigated to ensure that there are no problems with the water supply. Most complaints are related to discolored water, which is usually related to local construction or hydrant use. If you have a question or concern, please call your local water department or MWRA at 617-242-5323.

Tests In Community Pipes

MWRA and local water departments test 300 to 500 water samples each week for total coliform bacteria. Total coliform bacteria can come from the intestines of warm-blooded animals, or can be found in soil, plants, or other places. Most of the time, they are not harmful. However, their presence could signal that harmful bacteria from fecal waste may be there as well. If total coliform is detected in more than 5% of samples in a month, the water system is required to investigate the possible source and fix any identified problems. If a water sample does test positive, we run more specific tests for *E.coli*, which is a bacteria found in human and animal fecal waste and may cause illness. If your community found any total coliform or *E.coli*, it will be listed within the community letter on page 7.

Drinking Water And People With Weakened Immune Systems

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Contaminants In Bottled Water And Tap Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791) or MWRA. In order to ensure that tap water is safe to drink, Massachusetts DEP and EPA prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) and the Massachusetts Department of Public Health regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Research For New Regulations

MWRA has been working with EPA and other researchers to define new national drinking water standards by testing for unregulated contaminants. To read more about these regulations, and to see a listing of what was found in MWRA water, please visit www.mwra.com/UCMR/2017.htm.

Cross Connections Information

Massachusetts DEP recommends the installation of backflow prevention devices for inside and outside hose connections to help protect the water in your home as well as the drinking water system in your town.

For more information on cross connections, please call 617-242-5323 or visit mwra.com/crosscon.

WATERSHED PROTECTION keeps the water supply clean and safe while providing open space. All of the trees and protected land in the Quabbin, Wachusett and Ware River watersheds act as extra layers of protection from possible contamination. The protected land acts as a natural filter, and is one of the reasons MWRA water is often rated as among the best in the country. Since 1985, almost $150 million has been invested in land protection.

Wachusett Reservoir Overlook

John V. Scenna
Director of Public Works

City of Melrose
PUBLIC WORKS

Public Water Supply
3178000

City Hall, 562 Main Street
Melrose, Massachusetts 02176
Telephone - 781-979-4172
publicworks@cityofmelrose.org

Dear Consumer:

The Melrose Department of Public Works is pleased to provide this annual newsletter to keep you informed about your water system. This newsletter includes water quality test data, as well as other pertinent information about the water delivered to your property. We hope that this report provides you with a better understanding of your water supply and confidence in its use.

The City of Melrose purchases water directly from the Massachusetts Water Resources Authority (MWRA). The water is delivered from MWRA's transmission mains into the City's distribution system, a network of approximately 90 miles of pipes and hundreds of isolation valves and hydrants. The system delivers water to over 8,500 homes, businesses, and other facilities for drinking and other uses and provides fire protection throughout the City.

Melrose is continuing an intensive, citywide construction program aimed at upgrading water infrastructure. Water main replacements in 2017 included Day Street, Altamont Avenue, and Perkins Street between Warwick Road and the Stoneham line. Improvements to the water distribution system on Warwick Road were also initiated in 2017, with completion in 2018. These projects improve localized water quality and fire flows and decrease the City's overall water consumption through the elimination of pipes prone to leakage and breaks. These projects also include the replacement of all water services from the new main to the property line, typically accomplished with 1-inch copper service pipes. The City also continued replacing substandard water services on all roads slated for paving as part of our annual roads program. The improvements made in 2017 were consistent with our completed capital efficiency plan - a multi-year water main replacement program developed to keep pace with aging infrastructure and prioritize the needs of various water system components.

In 2017, the City continued our program to replace all domestic water meters in Melrose, allowing for increased accuracy, more efficient meter reading, and more timely identification of private water leaks. Approximately 96% of the residential properties in Melrose now have new meters. In addition, the City performed our biennial flushing of all water mains in the City, as well as our annual leak detection survey, which helps to identify areas of leakage within our distribution system.

Melrose tests tap water samples weekly in nine locations for coliform, an organism which may signal the presence of more serious bacteria. Should background coliform be noted in any sample, further testing is done to determine the presence of more hazardous organisms. No coliform was detected in any samples in Melrose in 2017.

Throughout the year, we continued to receive inquiries about lead in the drinking water. The simple answer is that there is no lead in the water supply that comes into Melrose or that travels through our water mains; however, lead can enter your tap water through contact with brass fixtures (which may contain lead in the alloy), lead solder (which is now outlawed), old indoor lead plumbing, or in the service line from the water main to your house. Melrose took samples in September 2017 from 15 homes with lead water services. The sample results showed the 90th percentile of Melrose's data at 24.2 parts per billion (ppb), which is above the lead Action Level of 15 ppb. The City continues to aggressively replace lead services within the City's right-of-way and perform sampling to monitor lead levels. The City also undertook extensive lead and copper sampling at all Melrose Public Schools buildings in 2017 in conjunction with MassDEP's sampling program. A total of 457 samples were analyzed from 247 different fixtures. Of these tests, 11 yielded results above the EPA's lead action level of 0.015 mg/L, and all samples were below the copper action level of 1.3 mg/L. Those few fixtures with higher levels were either removed from service or had standard operating procedures implemented to reduce exposure to below the Action Level.

The City will continue to work with the Melrose Health Department, schools, community clinics, hospitals, pediatricians, family planning clinics, and others to ensure that the citizens are informed about lead safety in water. To find out if you have a lead service line and how it can be replaced, please contact the Melrose Public Works Engineering Division at 781-979-4172. For more information about the potential for lead in tap water and steps you can take to reduce exposure, please see page 5 of this report.

If you require further information on particular topics, please call the City of Melrose Public Works Department Water Division at 781-979-4172 or the MWRA at 617-242-5323.

Sincerely,

John V. Scenna
Director of Public Work
